

Let there are 2 videos
on a page. They both have
some distinct data, as
shown below.

Now, what I am doing
in JS

On page load

Get all the
elements, that require
a youtube video

Create player
objects via IFrame API

↓ next page

prev page

A list of player
objects is create

For each player in the
list do:

```
ytanalytic = YTPlugin(  
    player, key)
```

```
ytanalytic.init().
```

Now the problem is that

For any event on
any video

Segment track events
data for video 1 or
2 is that of video
2.
